DESCRIPTION

Tide tables Netherlands - 2026

The tide also plays an important role in keeping the Netherlands safe. In this time of rising sea levels and climate change, we use the tidal information from measurements in recent years to keep a finger on the pulse. The Water Management Centre of the Netherlands, which emerged from the storm surge warning service established in 1921, uses the tidal calculations when issuing storm surge warnings. The experts at water boards use the tidal exceedance probabilities to determine the required dike height for maintenance and improvements.

This edition for the year 2026 includes the directly readable tide tables for 21 measuring points on the coast of the Netherlands, essential information for the intermediate measuring points and an explanation of the tide itself. More information about the tide can also be found online, but the essence is summarized in this beautiful and above all extremely useful booklet.
